Not illustrated. 1899 Excerpt: . voltage at full load will correspond to the energy loss in the system, and the converter voltage will be higher at lighter loads than at heavier loads, therefore will vary as the load varies, and phase control is thus feasible only by hand regulation, that is, in systems where the load varies only slowly as in lighting circuits. Reaction converters take lagging currents at all loads and thus are in general objectionable, the more so as they do not allow any automatic potential control. communicated After Adjournment By Charles P. Steinmetz. The striking distance is constant from 40 to 125 cycles, and probably for some range outside thereof. At zero cycles, that is, continuous electrostatic stress, a deviation may occur, due to a difference of the mechanical motion set up in the medium. Of very high frequency as 100,000 cycles or so, nothing can be...
